Morning Eldore

Please see below regarding the error list:

T22 43 – she did calve if 2025. It appears that when the calf died, the men forgot to record the death and it was not entered. Her calf birth was 5/5/2025 – male, calf T 25 523 – red.

T19 221 – did not have a calf. What is the procedure now that her interbirth period is 822days – does she automatically get removed? Or what happens now?

T17 211 – Commercial – please remove.

Calf T26 57 – I recorded the mother incorrectly and it should be T 17 233 (I incorrectly recorded it as T17 223)

T19 173 – commercial, please remove

T19 23 – please advise, can she remain on with the interbirth of 909 days.

Calf T26 116 – please advise – the error list says that T26 116 already exists. I checked the calf book and its Dam is definitely T23 124. I am not sure now?

Kind regards

Farrah

Dear Breeder

The Logix system is a very refined system and many checks and tests are done before being incorporated into the system. Logix's aim is to ensure that all biological and breed standards are adhered to and thus ensure that reliable (clean) data is recorded for further use in Genetic evaluations. This results in Editing lists, also known as "Error lists" being generated after the clerk cannot resolve the issues, and the breeder must be contacted to obtain further information to record the transaction fully.

Attached is your herd's Editing List and you are kindly requested to reply on every transaction. If such a transaction is not resolved within two (2) years, the transaction will be deleted from the system and you will have to resubmit it. These lists will be sent to you on a more regular basis for the purpose of improving our services to you.
